

SUMMARY

Staff-level platform and infrastructure engineer with 12+ years designing, building, and operating production systems across Kubernetes, AWS, Linux, and distributed infrastructure. I turn ambiguous infrastructure problems into durable self-service platforms, APIs, and operational patterns, and lead cross-team initiatives from RFC and architecture review through adoption. My work spans developer platforms, reliability, zero-trust security, production operations, and automation that reduces toil without hiding important system behavior from engineers.

SKILLS

Languages: Go, Python, Bash

Platform & Orchestration: Kubernetes, Kubernetes controllers, Helm, ArgoCD, Flux, Backstage, Linux

Cloud & Infrastructure: AWS, GCP, EKS, Terraform, Ansible, Packer, multi-account and multi-region deployments

Reliability & Observability: Prometheus, Grafana, OpenTelemetry, ELK, incident response, on-call operations

Security & Delivery: SPIRE, OPA, Vault, mTLS, Jenkins, GitHub Actions, Semaphore, Atlantis

EXPERIENCE

• Confluent

Senior Software Engineer II, Developer Productivity

Remote

April 2025 - Present

- **Developer platform architecture:** Co-leading technical direction for the internal developer platform, owning the developer-experience and self-service roadmap and shaping foundational capabilities that help engineering teams provision, deploy, and operate services more reliably and safely.
- **Production reliability:** Re-architected a production policy-enforcement service that silently dropped critical configuration-change approvals when synchronous processing exceeded an upstream timeout. Designed an asynchronous, back-pressured architecture with dashboards and alerting, eliminating the silent-failure mode and the on-call toil it caused.
- **Infrastructure security:** Drove fleet-wide security and reliability hardening by automating service migration to zero-trust mTLS and modern least-privilege secret management, reducing operational toil while shrinking the credential attack surface.
- **Shared infrastructure control plane:** Leading evaluation and architecture of the company's AI gateway, a shared control plane for how services access large language models. Drove cross-team technical due diligence and source-level verification that caught a supply-chain compromise in a leading candidate before adoption; an earlier infrastructure evaluation I led avoided more than \$500K in annual spend by recommending against an unready deployment.
- **Operational automation:** Designed and shipped an AI agent that automates the end-to-end software-vulnerability remediation lifecycle; adopted as the organization's default, it remediated 300+ vulnerabilities in roughly five months. Championed its migration to a new autonomous-workflow platform and drove cross-team design reviews for the next architecture.
- **Technical leadership:** Authored RFCs and technical one-pagers that steered cross-team platform and infrastructure decisions, mentored engineers through design and ownership transitions, and taught engineers across the organization to build reusable developer tooling.

• Angi Inc

Senior Infrastructure Engineer

Remote

Sept 2023 - Mar 2025

- **Self-service platform APIs:** Built foundational components of the Angi One internal platform using Kubernetes controllers, Flux, and ArgoCD, enabling developers to provision applications and cloud services from a single declarative manifest and cutting production delivery time by 50%.
- **Platform adoption:** Partnered with application and observability teams to automate Backstage catalog component generation and improve service onboarding, discoverability, and system visibility across the engineering organization.
- **Platform documentation:** Led automation of documentation workflows from Kubernetes CRDs so platform documentation evolved with releases, reducing manual upkeep and support overhead.

- **Workday**

Senior Software Development Engineer, DevOps
Software Development Engineer III, DevOps
Software Development Engineer II, DevOps

Victoria, BC, Canada

May 2023 - Sept 2023

May 2021 - April 2023

May 2019 - April 2021

- **Multi-region cloud delivery:** Designed an automated AWS deployment pipeline for microservices across accounts and regions, standardizing service delivery and reducing recurring operations toil by more than four hours per week.
- **Policy and self-service infrastructure:** Implemented policy-based infrastructure workflows using OPA and Atlantis, giving developers safer self-service control over cloud resources while shifting security checks earlier in the delivery lifecycle.
- **Cloud and Kubernetes operations:** Built and operated production infrastructure across AWS and datacenter environments, including EC2, ECS, Route53, S3, RDS, Lambda, and Elasticsearch, while migrating applications and services onto an internal Kubernetes platform.
- **CI/CD foundations:** Developed Jenkins pipelines and shared delivery libraries used by multiple applications and services, improving consistency and repeatability across build and deployment workflows.
- **Cross-team enablement:** Spearheaded an initiative across operations and development teams that helped service owners take greater responsibility for production operations; mentored engineers as they grew into larger technical responsibilities.

- **NYU CUSP**

Associate Research Scientist
Assistant Research Scientist

Brooklyn, NY, USA

May 2015 - May 2019

June 2014 - May 2015

- **Container scheduling:** Developed Dockkeeper, a scalable and secure container scheduling and monitoring system using Docker and Prometheus to provision services across physical hosts; eliminated more than \$35K per year in VM licensing costs and improved host utilization by over 55%.
- **Distributed compute and storage:** Architected the NYU/CUSP Urban Observatory's multi-site physical infrastructure with dense compute and more than half a petabyte of storage, provisioned as multi-user mini-HPC environments using Ansible and Packer.
- **Production IoT operations:** Developed a secure, mission-critical IoT platform and CI/CD framework for deploying and operating more than 100 urban noise-monitoring sensors across New York City as part of the NSF-funded SONYC project.

EDUCATION

- **NYU Tandon School of Engineering**

Master of Science in Telecommunication Networks
Thesis - CitySynth: Imaging with a Network of Devices

Brooklyn, NY, USA

Aug. 2012 - May. 2014

SELECTED PROJECTS

- **AdguardController:** Developed a Kubernetes controller to automate DNS record management, replacing manual infrastructure changes with a declarative control loop.
- **UCSLHUB:** Developed resilient backend infrastructure using Kubernetes, JupyterHub, and Keycloak for the CUSP UCSL bootcamp, serving hundreds of students each year.
- **Homelab:** Operate a distributed HCI lab with Ansible and Terraform-managed KVM nodes, Ceph storage, Kubernetes, and network segmentation for testing distributed systems and multi-datacenter failure scenarios.
